Job taIf2sqlSynchronizationJob

Purpose and Status

The job synchronizes the TA data warehouse after the IF6020 accounting run. It is not configurable and is inactive by default in the job descriptor.

Processing

- The job checks the date of the last IF6020 accounting run and, after starting, waits for up to four hours for the accounting run to be completed on the current day.
- During this time, the system is checked at most 48 times at five-minute intervals.
- Once the accounting run is completed, the data is re-synchronized using the cached export configuration.
- If the system parameter for the date (IF6020 system parameter 21, date of the last accounting run) is empty, or if the accounting run is still not finished after four hours, the job terminates with a warning.

Schedule

Schedule the job after midnight, around the expected end of the nightly IF6020 accounting run. If the accounting run has already taken place on the current day, the synchronization starts immediately.
