System settings

Webdesk EWP leaves it to the administrator to define a range of **system settings** for personalization, monitoring, automation and the import and export of data.

There are the following **types of system settings:**

System parameters

System parameters are used to shape many basic settings in Webdesk. These are parameters that have a direct effect on the operation and appearance of the different Webdesk modules, for example password policies, booking behavior, determining the start page action, etc.

Jobs

Jobs serve as periodically running utilities for synchronizing and processing data. They make it possible to automate the processing and synchronization of mass data.

Jobs are used, for example, when synchronizing department and person data from the time management system, or when synchronizing calendar data from the groupware system, and can be configured with a particular execution interval.

--> more on this[2]

Connectors

Connectors are used to import data into (or export it from) Webdesk. They provide the infrastructure for importing and exporting data. This way not only can data from the time management system be synchronized, but databases can also be addressed or text files (CSV files) created.

Monitoring & log settings

Various **monitoring tools** give an overview of logged-in users, active jobs and the like. In addition there is the option of parameterizing the detailed log entries individually in the log settings.

--> more on log settings[5]

System messages

When irregularities are pending, such as system maintenance work or special events in the company, Webdesk users can be made aware of them by means of **system messages**. The system message is written by the administrator; duration, appearance and timing can be parameterized as desired.

Password management

Here you will find various settings for changing and resetting passwords, password criteria, and the other authentication options available in Webdesk.

--> more on this[7]

License information

Here you will find an overview of the total, free and used number of Webdesk licenses.

--> more on this[8]

Key values

Key values allow keyword lists for user-defined forms and applications to be managed, for example for drop-down lists in actions.

--> more on this[9]

Advanced functions

These functions allow **advanced administration** and **maintenance** of Webdesk EWP.

Here it is possible, for example, to clear or refresh various caches, to register particular modules, or to update the translation files.
