Job importExchangeRates

Purpose and status

The job imports exchange rates via the providers selected in the configuration. It is configurable and is inactive by default in the job descriptor.

Configuration

- **Select exchange rate provider** (currencyProviderList): One or more providers are called sequentially.
- **Overwrite existing rates** (overwrite): Replaces already stored rates with the imported values.
- **Reference currency** (referenceCurrency): Is always included in the selection of required currencies.
- **Import all currencies** or **Select currencies** (importAllCurrencies, currencyChooser): Either all currencies offered by the provider or only the selected currencies are processed.
- **Time interval** (timeInterval): **Days back** (daysBack, at least 1) or **Since** (fromDate).

Processing

- A buffer period is taken into account for the start period so that weekends and public holidays are covered.
- With several providers, the provider processed later overwrites the previous value for duplicate currencies.
- New currencies are registered by the common import service.
