New Features in 4.60

New Job for Importing Profile Pictures from Azure AD via GraphAPI

A new job has been introduced that can import photos from Azure AD (Entra ID) via the GraphAPI.

Upon request, the job can be configured for your system.

New Branding Option for Raiffeisen Customers

A new Raiffeisen branding has been created for Raiffeisen customers. It includes the Raiffeisen logo, and the user interface is designed in Raiffeisen's color scheme, according to the specifications provided.

To switch the design, the option *PoOptions.branding* in the system parameters must be set to *"RAIFFEISEN"*.

Time Models

The weekly programs have been extended so that more cycles can now be entered for the time models. This makes it possible to create more complex and detailed time models.

Time Corrections

For time corrections where the automatic loading of bookings is enabled, it can now be configured that 0-minute bookings are automatically deleted as soon as the request is submitted.

The requester is informed with a validation message about the faulty 0-minute bookings. These can be removed manually, or they can be left in place, and they will then be removed automatically from time tracking.

The requests can be switched over upon request.

Performance Improvement and Consistency Assurance

In HR Expert, the loading speed when opening persons has been improved.
