Job Fill up WF List caches

The job **fillupWfListCaches** pre-fills the workflow list cache for valid persons. In the supplied descriptor it is currently **not active** and cannot be configured via its own configuration form.

Processing

1. The job loads all currently valid persons.
2. Persons without a workflow ID are skipped.
3. For each remaining person, the first page of the workflow lists is preloaded via the WfListItemCacheFiller.
4. A progress status is logged for every 100 persons processed.

The cache at.workflow.webdesk.wf.LISTITEMCACHE is used. If interrupted, the cache is written to disk. The job is mainly suitable for smaller systems, since processing is carried out across all valid workflow persons.

The general job parameters such as trigger and mail notification apply as defined in central job management.
