4.59.22

Release Notes - Webdesk - Version 4.59.21 - April 9, 2025

Bug Fixes

- [WD-18617[1]], [WD-18603[2]] – An error message occurred when editing newly created travel report configurations (*tm_getOrgTravel*). In addition, it was no longer possible to save assignments without a travel type.
- [WD-18414[3]] - The presence and absence reasons were displayed in the wrong language in each case. The display now matches the user's selected language setting again.
- [WD-18613[4]] - When selecting absence reasons in the job type *syncCalendarDates*, entries with the same name were no longer distinguished by their code. The codes are now displayed correctly again.
- [WD-18609[5]] - Creating new repositories of type *CMIS* was not possible without any visible feedback. This problem was fixed.
- [WD-14211[6]] - The comparison of standard process definitions incorrectly failed, causing an unnecessary update on every server start. The comparison now works correctly and loads the definitions only when there are actual changes.

Improvements

- [WD-18291[7]] - Several items were implemented for the simplified version of the Appraisal Interview:
  - Automatically prefilled observation periods
  - Improved email notifications
  - Ability to leave the process if no appraisal took place
  - Prevention of forwarding as long as no appointment has been scheduled
  - Optional hiding of irrelevant information (e.g. questionnaires, job info)
