4.59.33

Release Notes - Webdesk - Version 4.59.33 - August 6, 2025

Improvements

- [WD-19065[1]] - The previously incompletely implemented link function for system and confirmation messages was removed completely. This also includes the cleanup of the database as well as an upgrade script for the safe removal of the column.

Bug Fixes

- [WD-19301[2]] - An error message occurred when opening the action *po_showSystemMessages.act*. This problem was fixed and system messages can now be displayed correctly again.
- [WD-19176[3]] - The Webdesk interface was not displayed correctly on iPhones. In particular, the burger menu was missing and actions were not clickable. The display and usability were corrected for iOS devices.
- [WD-19221[4]] - In the group calendar, the URL parameter autoStartProcessAndReturn=true no longer worked after being used once. This behavior was corrected so that processes now start as expected on repeated use and return to the calendar.
- [WD-19107[5]] - When downloading the "Course Costs" report in Excel format, the additional browser tab with a loading indicator remained open. The tab is now closed automatically after the download starts, as intended.
