4.60.17

Release Notes - Webdesk - Version 4.60.17 - July 31, 2025

Do not use this version! Due to an error, no actions can be opened in this version. Fixed in 4.60.18

Improvements

- [WD-19251[1]] - The *employeeId* of persons was integrated into the Data Warehouse (IF2SQL). This information is now available in the *PersonDataStatus* table, which makes analysis and report creation easier.

Bug Fixes

Optimizations for Mobile Devices and PW App

- [WD-19235[2]], [WD-19236[3]] - Several errors were fixed in the Personalwolke app for iOS:
  - The display of the live chat was improved so that the header is displayed correctly on devices with a notch.
  - A JavaScript error related to the function *checkWebdeskPackage* was fixed, which had led to rejection in the Apple App Store.
- [WD-19176[4]] - On iPhones, the menu of the Webdesk interface was not displayed correctly. Navigation was only partially possible and led to error messages. This display problem was corrected.
- [WD-19003[5]] - Clicking the logo with the "Personalwolke" lettering in the top bar did not lead to the home page as expected. The error was fixed so that the click now correctly navigates to the homepage.

Correct Behavior in Project Time Tracking (PTM)

- [WD-19277[6]] - In systems with mixed TA/PTM usage, an error message occurred when users without a TA assignment opened the PTM booking form. The cause – access to holiday data without a valid TAID – was fixed.
