4.60.19

Release Notes - Webdesk - Version 4.60.19 - August 7, 2025

Improvements

- [WD-19188[1]] - When assigning field definition groups in the client settings, the technical name is now displayed in addition to the display name. This makes it easier to distinguish groups with the same name.

Bug Fixes

- [WD-19168[2]], [WD-19221[3]], [WD-19252[4]], [WD-19287[5]], [WD-19217[6]] - In various calendar views (calendar, group calendar, absence calendar), incorrect or outdated attendance and absence data was displayed. In addition, bookings were displayed incorrectly when approvals were delayed or daily programs were changed. The underlying problems with status displays, URL parameters, and booking sorting were fixed.
- [WD-19189[7]] - Faulty group calendar entries caused an HTTP 500 error without detailed log entries. The cause of the error was identified and eliminated; logs now contain meaningful error messages.
- [WD-19196[8]], [WD-19149[9]] – In the mobile view, calculated travel costs were not displayed. In addition, the selection of entries in the traveltype configuration was restricted. Both display errors were corrected.
- [WD-19272[10]] - The performance when loading deeply nested directory structures in the Folder Explorer was improved. Queries in Alfresco now respond faster.
- [WD-19288[11]] - Changes to process definitions were not replicated correctly on cluster nodes. The cache behavior was revised so that updates are now visible consistently system-wide.
- [WD-19308[12]] - In the "Organizational Units" report, the "GDPR – Personal Data" report was displayed by mistake. The link was corrected.
- [WD-19190[13]] - The "Time of last password creation" field was not visible in the person profile. This information is now displayed correctly again.
- [WD-19151[14]] - The icon selection in the action dialog no longer worked reliably when opened a second time. The problem was fixed.
