New Features in R3.2.2

General

After submitting a request via the context menu from the journal, you return to the journal after the process starts.

If a request is submitted via the context menu from the journal, it is now possible, using a sub-button "Start process and go back", to return to the journal without being automatically redirected to the workflow list "My requests".

Business Trip: Alternative Accounting for Receipts

It is now possible, via an additional field on the receipts, to make a particular receipt "taxable" when needed. At the same time, an additional accounting type was also set up that makes a receipt taxable by default.

There are now 2 new accounting variants:

- fully taxable
- taxable when the additional field is activated

Travel Request and Travel Expense Report: Attaching Files Is Now Possible

Attachments to the business trip or travel expense report, such as scanned receipts, can now be added.
The receipts are scanned and filed, and the user fills out the travel expense report as usual. Under item 5 **Files**, it is possible to add an attachment.

The parameter is located in the Travel types menu item when an existing travel type is opened:
Adding files possible.

Hiding the "Vehicle" Column in the Mileage Allowance Is Possible

If no vehicles are stored in the Business Trip module, it is now possible to remove the "Vehicle" column, since this parameter then has no function.

The parameter is located in the Travel types menu item when an existing travel type is opened:
Show vehicle in mileage allowance.

Improved Performance in the Transfer Booking Views

The performance when fetching and releasing transfer bookings in the transfer booking views was improved.

Workflow List: Bulk Processing of Requests Is Now Possible

Bulk processing of requests is now possible using the "Perform selected actions" button (function as in WD2.x).
This applies to the following actions: Approve, Reject or Review.

The following system parameter in the Webdesk Administrator (menu item System >> System parameters) must be set to true:
useJavaWfListHandler.

DB Connector Performance

The performance of the DB connector was effectively improved.

Summarize Connector: It Is Now Possible to Filter Out Rows with Amounts of 0

If needed, 0 values can be filtered out using a new parameter:
