Text modules

Webdesk EWP is fully **multilingual** and can be parameterized and maintained independently by the administrator. To make this possible, so-called **text modules** have been built in.

As an administrator, you access the text modules via the menu tree under

SYSTEM
--> Text modules

Here you will find an overview of all existing text modules. Each text module is characterized by a **key** and a **value** (or translation). In addition, each text module is assigned to an action and a language.

To make the maintenance of the text modules easier, the following naming convention has been defined for the key:

<Webdesk module>_<action name>.<action type>_description

- Example: this is the heading "Language code" within the action "showTextModules.act" in the module "Portal & Organization" - the key is therefore --> **po_showTextModules.act_lngcode**
- Depending on the language selected in the user's browser, the correct **translation** is displayed. In the editing view of the text module, translations for other languages can be defined.
  more on this under -> Editing and translating text modules

Key	Language	Translation
po_showTextModules.act_lngcode	German	Sprachcode
po_showTextModules.act_lngcode	English	Languagecode

There are also text modules that are not assigned to an action. These mostly contain **translations** that are valid for an entire module and change never or only rarely. The **principle of inheritance** applies to these text modules (e.g. translations for "client", "group" or "valid from"). It was introduced so that one and the same word does not have to be translated several times in many forms. This allows a text module to "inherit" the translation of another text module.

Felder

Name	Wert
Modul	Portal & Organisation (po)
Webdesk Actionname	po_showTextModules
Artefakt-Typ	Action
