New Features in 4.50

Time Correction "Inverse Flow" Mode

The time correction now has a new mode that writes the corrections to the time tracking system immediately (after the process is started). If the process is rejected by supervisors, the corrections of the process are reverted.

NOTIZ

This mode is **NOT** enabled by default for existing time correction processes. Furthermore, it can only be used in combination with the options "Overwrite entire days" and "Load bookings automatically".
